'Mogens Heller Jensen' wrote in message news:43\*\*\*\*\*@nntp02.dk.. Unfortunately the widely used Windows OS is insecure by design Almost every of the 'bad design points' described in apply to Windows.. What do I need to do? Monitors and harddisks are platform specific In order to obtain useful and competent answers, you should ask this question in a forum dedicated to the computers you are trying to destroy.

I see no other way to actually destroy hardware Ok it's possible to 'brick' a BIOS Flash i.. Naw, I think the newsgroup he belongs in is 'alt I am a dumbass troll';) Best Kai-Uwe Bux Jon.. Its written in C++ So, that solved half your problem You dont have to start from scrap.. OTOH on a sanely designed system you will hardly find executables you can overwrite without root permission.

### [Free Hotspot Shield For Pc](#)

I'm writing a destructive trojan with C++ and I need to know how I can destroy the target's monitor and format the target's harddisk before the target can stop the program.. Hehe, nice try If you format the harddisk on a \*nix your programm will probably immediately stop after the first bytes of the FS have been nulled.. e Overwriting it with garbage But that is reversible with a flasher And format the target's harddisk before the target can stop the program.. telia net 'Mad Programmer' wrote in message news:dg\*\*\*\*\*@domitilla.aioe.org. Wolfgang Draxinger 'Kai-Uwe Bux' wrote in message news:dg\*\*\*\*\*@murdoch acc.. However these can be recovered Really: Writing a destructive programm doesn't show skill but immaturrenes.. And if \$HOME is on a parition mounted with the 'noexec', option then it's almost impossible to get malcode permanently on the system.. However you might have to write logics on top of that to come up with a good antivirus. cea114251b [Jimi Hendrix Experience Smash Hits Rar Download](#)
